

android os 에 일리히트엔진 올려보기 강좌.(irrlicht 엔진 1.7.1 base)

킬리만자로에서... 밥을먹는선비

4-5 minutes

3. C/C++ 부분 코딩하기

3-1. 헤더파일 자동성생하기

bin폴더에서 액티비티 클래스를 인자로 javah를 실행시킨다.

생성된 헤더파일을 jni/src 에 카피한다.

3-2. 연결코드 예

```
#include "com_andricht_sample1_main.h"

#include <irrlicht.h>

irr::IrrlichtDevice *pDevice;
irr::video::IVideoDriver *pVideo;
irr::scene::ISceneManager *pSmgr;
irr::gui::IGUIEnvironment *pGuiEnv;

void init()
{
    pDevice = irr::createDevice(
        irr::video::EDT_OGLES1,
        irr::core::dimension2du(480,778)
    );
    pDevice->setWindowCaption(L"Type-A2");
    pVideo = pDevice->getVideoDriver();
    pSmgr = pDevice->getSceneManager();
    pGuiEnv = pDevice->getGUIEnvironment();
    pSmgr->addCameraSceneNode(0, irr::core::vector3df(0,0,-5), irr::core::vector3df(0,0,0));
}
```

```

void update()
{
    static irr::u32 uLastTick=0;

    //밀리세컨드값얻기

    irr::u32 uTick = pDevice->getTimer()->getTime();

    irr::f32 fDelta = ((float)(uTick - uLastTick)) / 1000.f; //델타값 구하기

    uLastTick = uTick;

    irr::video::S3DVertex Vertices[4];

    irr::u16 Indice[6];

    Vertices[0] = irr::video::S3DVertex(-.5,-.5,0, 0,0,-1,irr::video::SColor(0,0,255,255),0,1);
    Vertices[1] = irr::video::S3DVertex(-.5,.5,0, 0,0,-1,irr::video::SColor(0,255,0,255),0,0);
    Vertices[2] = irr::video::S3DVertex(.5,.5,0, 0,0,-1,irr::video::SColor(0,255,255,0),1,0);
    Vertices[3] = irr::video::S3DVertex(.5,-.5,0, 0,0,-1,irr::video::SColor(0,0,255,0),1,1);

    Indice[0] = 0;

    Indice[1] = 1;

    Indice[2] = 2;

    Indice[3] = 3;

    Indice[4] = 0;

    Indice[5] = 2;

    pVideo->beginScene(true, true, irr::video::SColor(255,100,101,140));

    pSmgr->drawAll();

    pGuiEnv->drawAll();

    //직접 그리기

    {

        irr::core::matrix4 mat;//단위행렬로초기화

        mat.makeIdentity();

        pVideo->setTransform(irr::video::ETS_WORLD, mat); //변환초기화

        irr::video::SMaterial m;

        m.Lighting = false; //라이트를꺼야 색이 제데로나온다.

        //m.ZBuffer = false;
    }

```

```

pVideo->setMaterial(m);
}
pVideo->drawIndexedTriangleList(
Vertices,
4,
Indice,
2
);
pVideo->endScene();
}
void resize(int w,int h)
{
irr::core::dimension2du size(w,h);
pVideo->OnResize(size);
}
#ifdef __cplusplus
extern "C" {
#endif
/*
* Class:   com_andrlicht_sample1_main
* Method:  nativeInit
* Signature: ()V
*/
JNIEXPORT void JNICALL Java_com_andrlicht_sample1_main_nativeInit
(JNIEnv *env, jobject obj)
{
init();
}
/*
* Class:   com_andrlicht_sample1_main
* Method:  nativeSetResDirectory

```

* Signature: (Ljava/lang/String;)V

*/

JNIEXPORT void JNICALL Java_com_andrlicht_sample1_main_nativeSetResDirectory

(JNIEnv *env, jobject obj, jstring str)

{

}

/*

* Method: nativeUpdate

* Signature: ()V

*/

JNIEXPORT void JNICALL Java_com_andrlicht_sample1_main_nativeUpdate

```

(JNIEnv *env, jobject obj)
{
update();
}
#ifdef __cplusplus
}
#endif

```

이런식으로 만든 cpp파일을 jni/src에 생성한다.

4. 컴파일 하기

Application.mk파일을 내용에 맞게 수정한다.

APP_MODULES := [프로젝트이름]

jni/adroid.mk 를 내용을 맞게 수정한다.

MYAPP_SRC = [컴파일할 cpp 파일이름들]

LOCAL_MODULE := [프로젝트이름]

시크윈에서 ndk 디렉토리를 찾아가서 make APP=[프로젝트이름] 해서 컴파일을 한다.

```

/cygdrive/e/android/android-ndk-1.6_r1-windows/android-ndk-1.6_r1
$ make APP=andrlicht_sample1
Android NDK: Building for application 'andrlicht_sample1'
Compile++ arm : andrlicht_sample1 <= apps/andrlicht_sample1/jni/src/com_andrlic
ht_sample1_main.cpp
apps/andrlicht_sample1/jni/src/com_andrlicht_sample1_main.cpp: In function 'void
Java_com_andrlicht_sample1_main_nativeOnEvent(JNIEnv*, _jobject*, _jobject*)':

```

5. 실행하기

일식편집기에서 꼭 리프레쉬를 한번 한후에 실행시켜야한다.

(일식편집기 패키지뷰어에서 .so 파일 확인 필수!)

6. 보너스

안된다고 하시는 분들이 계셔서 확인된 샘플코드 까지 추가로 올려드립니다.

app폴더에 andrilicht_sample1.zip을 압축푸셔써 andrilicht_sample1이름으로 만든 디렉토리에 푸시고요.

으로 컴파일합니다.
